Summary

Backend and platform engineer. I was one of three engineers who built Datadog's Case Management product from scratch, and I am now tech lead of the five-engineer team that owns it. Most recently I made AI agents first-class workers in it: agents that get assigned real tickets, act on them through their own tools, and stay accountable for what they did. Looking to do that somewhere agents are the product rather than a feature.

Work Experience

Datadog

Paris, France

SENIOR SOFTWARE ENGINEER

2025 - Present

- **Set the technical direction** for the five-engineer team on Case Management, the ticketing product teams use to track incident, security and alerting work, and the shared layer five other Datadog products build on. Now used weekly by **15,000 customer organisations** across every production region.
- Took AI agents from proposal to production as first-class actors on that platform, including the **MCP** tools they use to act on a ticket, reaching **10,000 tickets assigned to agents** within the first months (public documentation).
- Benchmarked coding agents against real customer support tickets **before** committing to the product, and scoped the first version around what the results actually showed rather than the demo.
- Designed how autonomous agents get identity and permissions in a multi-tenant system: who the agent acts as, who delegated it, and whether its access can exceed theirs. Adopted by **three platform teams**.
- Led the platform's **reliability work**, including the finding that an agent action which starts an LLM cannot be undone if its trigger arrives twice. Used it to hold an upstream team to ordering guarantees before adopting their service.
- Shipped features whose code had to land inside **six other teams' services**, writing it myself rather than filing requests, and built the per-tenant settings service every feature now configures through.
- **Core Incident Commander** in Datadog's company-wide rotation, including a SEV-1 that took the web application down across a region; gave an org-wide talk on agentic engineering practice.

Datadog

Paris, France

SOFTWARE ENGINEER

September 2021 - 2025

- **One of three engineers who built Case Management from scratch**, joining as a new graduate: guided the architecture decisions and wrote most of the initial Go backend and TypeScript/React frontend, growing it from nothing into a layer five other products depend on.
- Automated Elasticsearch provisioning for new datacenters and completed a multi-tenant organisation data-store migration, so that standing up a new region no longer needs manual work.
- Led a Postgres migration and fixed the deadlocks and event-relay failures behind the platform's recurring reliability incidents.
- Built two-way synchronisation with third-party ITSM tools and the on-call paging path, the integrations enterprise customers most often required.

Datadog

Paris, France

SOFTWARE ENGINEER INTERN

February 2021 - August 2021

- Migrated the event product's backend to a new in-house storage solution, and built a distributed rules-based aggregation engine on Apache Kafka.
- Built high-throughput realtime distributed systems in Go, Python and Java, deployed with Kubernetes and Helm.

TicketSwap BV.

Amsterdam, The Netherlands

BACKEND ENGINEER INTERN

July 2019 - November 2019

- Built a GraphQL API and a ticket-buying module integrating Dutch and international ticket providers, which sold 1200 tickets during the internship.

Education

ESEO (École Supérieure d'Électronique de l'Ouest)

Angers, France

MSC IN COMPUTER SCIENCE AND EMBEDDED SYSTEMS

September 2016 - August 2021

- French *diplôme d'ingénieur*. Coursework included real-time programming, embedded system design, Linux architecture, and data structures and algorithms.
- **irc-rs**: an IRC server written from scratch in Rust, using raw TCP sockets, per-connection threading, and channel and user state machines.

Skills

Programming	Go, TypeScript/React, Python, Java; Rust and C from side and academic projects
Distributed Systems	gRPC, Protocol Buffers, Apache Kafka, Postgres, Elasticsearch, Redis, REST, GraphQL
Infrastructure	Kubernetes, Docker, Helm, Terraform, Consul, Bazel, CI/CD
Multi-tenancy	Per-tenant RBAC and permission enforcement, multi-region rollout, isolated-region deployment
AI / Agents	Agent identity & delegated authorisation, MCP tool design, audit and attribution of agent actions, idempotency for actions that cannot be undone
Languages	French (Native), English (Fluent), German (intermediate)
